Construction Management Of Healthcare Projects (P/L Custom Scoring Survey)

Synopsis

A complete, practical guide to managing healthcare facility construction projects Filled with best practices and the latest industry trends, *Construction Management of Healthcare Projects* describes the unique construction requirements of hospitals, including building components, specialized functions, codes, and regulations. Detailed case studies offer invaluable insight into the real-world application of the concepts presented. This authoritative resource provides in-depth information on how to safely and successfully deliver high-quality healthcare construction projects on time and within budget. Coverage includes: Regulations and codes impacting hospitals Planning and predesign Project budgeting Business planning and pro formas Healthcare project financing Traditional delivery methods for healthcare projects Modern project delivery methods and alternate approaches The challenges of additions and renovations Mechanical and electrical systems in hospitals Medical technology and information systems Safety and infection control Commissioning of healthcare projects Occupying the project The future of healthcare construction

Book Information

Series: P/L Custom Scoring Survey

Hardcover: 416 pages

Publisher: McGraw-Hill Education; 1 edition (January 14, 2014)

Language: English

ISBN-10: 0071781919

ISBN-13: 978-0071781916

Product Dimensions: 7.6 x 0.9 x 9.6 inches

Shipping Weight: 1.5 pounds (View shipping rates and policies)

Average Customer Review: 3.8 out of 5 stars 7 customer reviews

Best Sellers Rank: #703,942 in Books (See Top 100 in Books) #62 in [Books > Law > Business > Construction](#) #86 in [Books > Crafts, Hobbies & Home > Home Improvement & Design > How-to & Home Improvements > Estimating](#) #187 in [Books > Arts & Photography > Architecture > Project Planning & Management](#)

Customer Reviews

Sanjiv Gokhale, Ph.D., P.E., F. ASCE,, Professor of Civil Engineering, Department of Civil and Environmental Engineering, Vanderbilt University, has taught construction project management courses to undergraduate and graduate students since 2001. He is the recipient of the 2009 Distinguished Professor award by the Construction Industry Institute (CII) and received the

Teaching Excellence award from the School of Engineering, Vanderbilt University, in 2005. Dr. Gokhale is coauthor of Trenchless Technology: Pipeline and Utility Design, Construction, and Renewal (McGraw-Hill Professional, 2005). Thomas C. Gormley, LEED-AP, Associate Professor and Director of the Commercial Construction Management program at Middle Tennessee State University, recently started teaching after nearly 40 years in hospital construction. He has worked as a contractor, an owner, and a program manager in the US, Europe and the Middle East. He is working on his dissertation for his PhD in Environmental Engineering at Vanderbilt University. For over 10 years, Mr. Gormley has served on the committee that writes the Guidelines for the Design and Construction of Healthcare Facilities – the nationally recognized standard for hospitals. He is a Board member of the American Hospital Association's Certification Center and served on the committee that wrote the test for Certification of Health Care Constructors, which is a nationally recognized certification for builders.

This book provides a very good summary of the complexities involved in healthcare construction as stated in the previous reviews. As a construction project manager and licensed architect looking to break into the health care construction field, I found this book to be a good starting point but only a starting point. Continued research into the AHCA, Joint Commission and NFPA99 are necessary to even begin to become versed in this complex topic.

The book by itself is good the content is not what i needed/expected

Great, Thanks

Great for who design or manage hospital project.

Chapter 1: What's Different About Hospitals. I thought the chapter was a good overview, but missed the opportunity to highlight and address the intense political, emotional and reality drama that surrounds the healthcare facility environment. We in the industry often joke about hospitals being the first settings for television soap operas (and there are reasons for that) but in all seriousness the healthcare construction manager needs to be acutely aware of the dynamics that are embedded in the hospital environment that simply don't exist in other facility settings. Chapter 2: Codes and Regulations. The discussion on accreditation organizations should perhaps mention other orgs that

have *“deemed status”* from CMS. These include AOA and more recently DNV, which has been gaining on TJC in terms of numbers of facilities accredited. While the purpose of these various accreditation orgs is generally the same, the codes/standards as well as the survey processes they use vary widely, and the construction manager should be aware which org any particular healthcare system is using, and the various impact on project delivery.

Chapter 5: Healthcare Facility Justification and Capacity: The conclusions drawn at the end of this chapter are, I believe, debatable. The degree to which the health care industry has *“evolved over time to a highly refined process”* may have been true up to a point some years ago, but I would submit that healthcare reform (both organic and legislatively driven) has unwound some of the processes built up over the decades. Changing demographics, uncertain and varied reimbursement pictures and the velocity of change in both have unseated some standard planning processes. While I don’t disagree with the pretext that the most effective management of project cost is done in the early planning stages, I would caution against any characterization of the planning process as mature.

Chapter 7: Project Delivery Methods for Healthcare Projects: While this chapter gives a good overview of a difficult-to-capture subject, I believe the description of the A/E team selection, as well as of the deliverables that can be expected from those professionals, are drastically oversimplified and may give the construction manager the impression that both are rote processes with very little variation. The opposite is actually true: we are seeing more variation in both selection processes and the nature and detail of deliverables than ever before.

Chapter 8: Modern Project Delivery Methods for Healthcare Projects: Page 161 discusses BIM, but I believe way understates the impact of BIM technology and usage on the entire planning, design and construction process. The construction management student should be led to believe that BIM is changing the entire process from the inside out, which I believe it is. Pages 162 and 163 discuss the impact of prefabrication on a typical project, and that discussion could benefit from adding some perspective of the impact of prefabrication on the design phase, where elements of the design process many times must be pulled out of sequence in order to facilitate an effective prefabrication program.

Chapter 9: Challenge of Additions and Renovations: A good overview of the challenges. Consider making the reader aware of the need to verify existing utility distribution before consideration of demolition of portions of an existing campus or building that was built in multiple phases. Often utilities feed from the *“oldest to the newest”* in terms of progression of construction, and demolition of the oldest buildings first can present major challenges as utilities feeding through

those buildings might feed other buildings that are to remain.â Chapter 10:

Mechanical and Electrical Systems in Hospitals: The chapter could benefit by some awareness of the potential impact on Hospital Acquired Infections by the HVAC systems, particularly with respect to airflow and pressure relationships. HAI issues are discussed well in Chapter 12, but the direct connection to HVAC systems isnât highlighted. Also, Chapter 10 provides some general discussion on project delivery methodologies that seems to overlap (and contradict to some degree) the discussion in earlier chapters.â Chapter 11: Medical Technology and Information Systems. Chapter provided good definitions of medical equipment and function, but didnât speak to the critical process of planning, specifying, purchasing and coordinating utilities and space requirements for medical equipment. This could almost justify a paragraph of itâs own, with the potential impact to overall project budget, planning, design, coordination and installation. While there is some discussion of planning for IT systems, I could see little provided for equipment.â I may have missed this, but didnât see any discussion on exterior skin, and the necessary planning and design required. Envelopes now touch many disciplines from structure to architecture to HVAC, and must be evaluated carefully. Where to place vapor barriers is but one subtle but potentially impactful detail.

Healthcare projects have many unique elements making them among the most complex of capital projects. Construction Management of Healthcare Projects successfully identifies the differences and focuses on the special skills needed from planning through turnover. Construction Management of Healthcare Projects is a great resource to understand the whole process as well as the pieces and parts. Wayne A. Crew, Director, Construction Industry Institute

Nicely weighted and sharp. Very well-made. so fast, receive it next day , great, and very happy. my sister need it , 5 star.
